

Environmental Attributes of Woven Carpets

Considered to be the most environmentally responsible carpet construction in the industry, woven carpets have an average service life that is 3 times greater when compared to tufted carpets.

Many woven carpet construction components are made with rapidly renewable materials. Using a combination of wool, cotton and jute fibers, many woven products have rapidly renewable components in excess of 90%. While many woven carpets use synthetic yarns like nylon and polyester, those yarns often contain recycled content, as well as a combination of rapidly renewable components within the backing structure.
